

Packet tracer – laboratory test

Allotted time: 1h 30 min

Date: 13.01.2025

1. All the IPs from the local area networks (N1, N2, N3 and N4) are allocated from the range 179.26.224.0/19. Perform subnetting (using the minimum subnet size) such that:
 - LAN1 can store 2040 hosts
 - LAN2 can store 1021 hosts
 - LAN3 can store 250 hosts
 - LAN4 can store 125 hosts
2. On at least one of the LANs use DHCP to assign IPs to hosts, and in N3 add a HTTP server.
3. Configure dynamic routing using RIP v2.
4. Configure NAT on a router, such that all the packets coming from N1 and going to the N3 network (with the sever) are translated.
